**STROKE**  
*Improving systems of care*

*If you had a stroke,  
wouldn't you want the  
**best treatment?**  
**available?***

**WELCOME**

# WELCOME

This webinar is hosted by the National Association of Emergency Medical Technicians (NAEMT) and supported by an educational grant from Medtronic.

# WELCOME

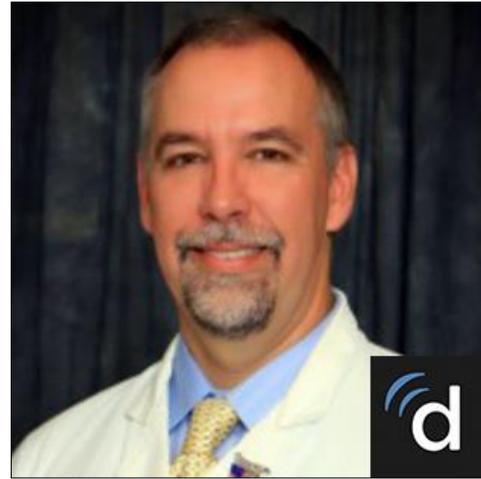

- This webinar will be recorded for future viewing on the NAEMT website.
- There will be a question-and-answer period at the end of the webinar.
  - To ask your question, please send it via the chat box in the bottom right of your screen.
- If you have questions at any point throughout the webinar, please send them via the chat box.
- If you have technical issues, please send a message to Faith James via the chat box.

**GET AHEAD OF STROKE**

# GET AHEAD OF STROKE OVERVIEW

## WHO?

Society of  
NeuroInterventional  
Surgery and partners

## WHAT?

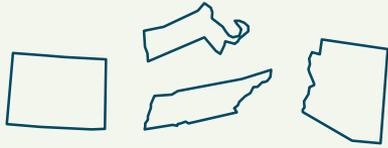

Improve care for  
stroke patients.

## HOW?

Update state  
stroke policies.

# GET AHEAD OF STROKE OVERVIEW

## WHERE?

Nationwide, with recent efforts focused in AZ, CO, MA, NY, OH, TN, and VA.

## WHY?

We can reduce the likelihood of disability and save lives.

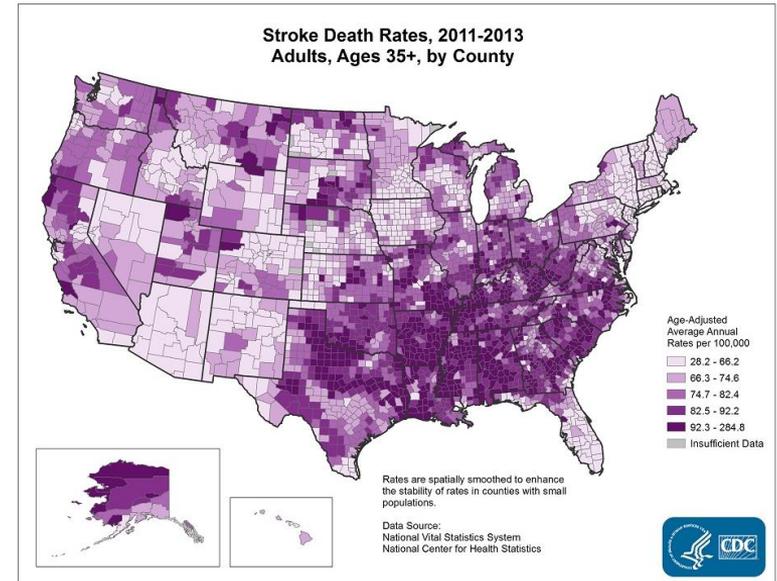

## WHEN?

Now, but we are committed to improving stroke systems of care over the long term.

# THE REALITY

- Stroke is a leading cause of death and long-term disability in the U.S.
- More than 795,000 people in the U.S. have a stroke every year.
- Stroke kills about 140,000 people in the U.S. each year.
- The vast majority of strokes (87 percent) are ischemic strokes, caused by a blood clot in the brain.

# ISCHEMIC STROKE SYNDROMES

Left Hemisphere	Right Hemisphere
Left gaze preference Right visual field deficit Right hemiparesis Right hemisensory loss	Right gaze preference Left visual field deficit Left hemiparesis Left hemisensory loss neglect
Cerebellum	Brainstem
Truncal/gait ataxia Limb ataxia Neck stiffness	Nausea and/or vomiting Diplopia, dysconjugate gaze, gaze palsy Dysarthria, dysphagia Vertigo, tinnitus Hemiparesis or quadriplegia Sensory loss in hemibody or all 4 limbs Decreased consciousness Hiccups, abnormal respirations

# HEMORRHAGIC STROKE SYNDROMES

## Hemorrhage

Focal neurological deficits as in AIS

Headache (especially in subarachnoid hemorrhage)

Neck pain

Light intolerance

Nausea, vomiting

Decreased level of consciousness

# RISK FACTORS FOR STROKE

## Modifiable Risk Factors

High blood pressure  
 Cigarette smoking  
 Diabetes mellitus  
 Carotid or other artery disease  
 Peripheral artery disease  
 Atrial fibrillation  
 Other heart disease  
 Sickle cell disease  
 High blood cholesterol  
 Poor diet  
 Physical inactivity and obesity

## Noncontrollable Risk Factors

Age  
 Heredity  
 Race  
 Gender  
 Prior stroke, TIA or heart attack

# COMMON STROKE MIMICS

Stroke Mimics
Hypoglycemia
Intracranial mass lesions
Seizures and postictal states (Todd's paralysis)
Migraine mimicking stroke
Functional hemiparesis
Encephalopathies and other toxic-metabolic conditions

## THE CHALLENGE

No clear protocol exists to ensure first responders transport ELVO stroke patients directly to a Level 1 stroke center for lifesaving treatment.

# THE SOLUTION

1. Educate emergency medical services (EMS) professionals about assessment and triage of severe stroke patients in the field.
2. Get more ELVO patients the treatment they need at Level 1 stroke centers – facilities with 24/7/365 neurointerventional care.
  - a. A new study (Holodinsky) shows that direct transfer to a Level 1 stroke center is better than the alternative, even if the stroke center is as many as 90 minutes away.
3. Update EMS protocols in all 50 states to ensure more patients survive stroke.

# THE SOLUTION

- 1. Educate emergency medical services (EMS) professionals about assessment and triage of severe stroke patients in the field.**
2. Get more ELVO patients the treatment they need at Level 1 stroke centers – facilities with 24/7/365 neurointerventional care.
  - a. A new study (Holodinsky) shows that direct transfer to a Level 1 stroke center is better than the alternative, even if the stroke center is as many as 90 minutes away.
3. Update EMS protocols in all 50 states to ensure more patients survive stroke.

# CINCINNATI PREHOSPITAL STROKE SEVERITY SCALE

<b>FACIAL DROOP</b> (The patient shows teeth or smiles)	<b>ARM DRIFT</b> (The patient closes their eyes and extends both arms straight out for 10 seconds)	<b>SPEECH</b> (The patient repeats "The sky is blue in Cincinnati")
<b>NORMAL:</b> Both sides of face move equally.	<b>NORMAL:</b> Both arms move the same, or both arms do not move at all.	<b>NORMAL:</b> The patient says correct words with no slurring of words.
<b>ABNORMAL:</b> One side of face does not move as well as the other.	<b>ABNORMAL:</b> One arm either does not move, or one arm drifts down compared to the other.	<b>ABNORMAL:</b> The patient slurs words, says the wrong words, or is unable to speak.

# LOS ANGELES PREHOSPITAL STROKE SCREEN

SCREENING CRITERIA	YES	NO	UNKNOWN	FACIAL SMILE/ GRIMACE	GRIP	ARM STRENGTH		YES	NO
1. Age over 45 years				<input type="checkbox"/> Normal	<input type="checkbox"/> Normal	<input type="checkbox"/> Normal	Based on exam, patient has only unilateral (and not bilateral) weakness:		
2. History of seizures or epilepsy absent				<input type="checkbox"/> Droop (Right)	<input type="checkbox"/> Weak grip (Right)	<input type="checkbox"/> Drifts down (Right)			
3. Symptom duration less than 24 hours				<input type="checkbox"/> Droop (Left)	<input type="checkbox"/> Weak Grip (Left)	<input type="checkbox"/> Drifts down (Left)	7. If Yes (or unknown) to all items above LAPSS screening criteria met:		
4. At baseline, patient is not wheelchair bound or bedridden					<input type="checkbox"/> No grip (Right)	<input type="checkbox"/> Falls rapidly (Right)			
5. Blood glucose between 60 and 400			N/A		<input type="checkbox"/> No Grip (Left)	<input type="checkbox"/> Falls rapidly (Left)	8. If LAPSS criteria for stroke are met, call receiving hospital with "CODE STROKE", if not then return to the appropriate treatment protocol.  (Note: the patient may still be experiencing a stroke even if LAPSS criteria are not met)		
6. Exam: Look for obvious asymmetry			N/A

# RACE SCALE

## RAPID ARTERIAL OCCLUSION EVALUATION STROKE

### Design and Validation of a Prehospital Stroke Scale to Predict Large Arterial Occlusion The Rapid Arterial Occlusion Evaluation Scale

Natalia Pérez de la Ossa, MD, PhD; David Carrera, MD; Montse Gorchs, BD; Marisol Querol, BD; Mònica Millán, MD, PhD; Meritxell Gomis, MD, PhD; Laura Dorado, MD, PhD; Elena López-Cancio, MD, PhD; María Hernández-Pérez, MD; Vicente Chicharro, MD; Xavier Escalada, MD; Xavier Jiménez, MD, PhD; Antoni Dávalos, MD, PhD

**Background and Purpose**—We aimed to develop and validate a simple prehospital stroke scale to predict the presence of large vessel occlusion (LVO) in patients with acute stroke.

**Methods**—The Rapid Arterial Occlusion Evaluation (RACE) scale was designed based on the National Institutes of Health Stroke Scale (NIHSS) items with a higher predictive value of LVO on a retrospective cohort of 654 patients with acute ischemic stroke: facial palsy (scored 0–2), arm motor function (0–2), leg motor function (0–2), gaze (0–1), and aphasia or agnosia (0–2). Thereafter, the RACE scale was validated prospectively in the field by trained medical emergency technicians in 357 consecutive patients transferred by Emergency Medical Services to our Comprehensive Stroke Center. Neurologists evaluated stroke severity at admission and LVO was diagnosed by transcranial duplex, computed tomography, or MR angiography. Receiver operating curve, sensitivity, specificity, and global accuracy of the RACE scale were analyzed to evaluate its predictive value for LVO.

**Results**—In the prospective cohort, the RACE scale showed a strong correlation with NIHSS ( $r=0.76$ ;  $P<0.001$ ). LVO was detected in 76 of 357 patients (21%). Receiver operating curves showed a similar capacity to predict LVO of the RACE scale compared with the NIHSS (area under the curve 0.82 and 0.85, respectively). A RACE scale  $\geq 5$  had sensitivity 0.85, specificity 0.68, positive predictive value 0.42, and negative predictive value 0.94 for detecting LVO.

**Conclusions**—The RACE scale is a simple tool that can accurately assess stroke severity and identify patients with acute stroke with large artery occlusion at prehospital setting by medical emergency technicians. (*Stroke*. 2014;45:87-91.)

# RACE SCALE

## RAPID ARTERIAL OCCLUSION EVALUATION STROKE

ITEM	INSTRUCTION		RACE Score
<b>FACIAL PALSY</b>	Ask the patient to show their teeth	<b>ABSENT</b> (symmetrical movement) <b>MILD</b> (slightly asymmetrical) <b>MODERATE TO SEVERE</b> (completely asymmetrical)	0 1 2
<b>ARM MOTOR FUNCTION</b>	Extending the arm of the patient 90 degrees (if sitting) or 45 degrees (if supine)	<b>NORMAL TO MILD</b> (limb upheld more than 10 seconds) <b>MODERATE</b> (limb upheld less than 10 seconds) <b>SEVERE</b> (patient unable to raise arm against gravity)	0 1 2
<b>LEG MOTOR FUNCTION</b>	Extending the leg of the patient 30 degrees (if supine)	<b>NORMAL TO MILD</b> (limb upheld more than 5 seconds) <b>MODERATE</b> (limb upheld less than 5 seconds) <b>SEVERE</b> (patient unable to raise the leg against gravity)	0 1 2
<b>HEAD AND GAZE DEVIATION</b>	Observe eyes and cephalic deviation to one side	<b>ABSENT</b> (eye movements to both sides were possible and no cephalic deviation was observed) <b>PRESENT</b> (eyes and cephalic deviation to one side was observed)	0 1
<b>APHASIA</b> If right hemiparesis	Ask the patient two verbal orders: - "close your eyes" - "make a fist"	<b>NORMAL</b> (performs both tasks correctly) <b>MODERATE</b> (performs one task correctly) <b>SEVERE</b> (performs neither task)	0 1 2
<b>AGNOSIA</b> If left hemiparesis	Asking: - "Who's arm is this?" while showing him/her the paretic arm (asomatognosia) - "Can you move your arm?" (anosognosia)	<b>NORMAL</b> (no asomatognosia nor anosognosia) <b>MODERATE</b> (asomatognosia or anosognosia) <b>SEVERE</b> (both of them)	0 1 2
<b>RACE SCALE TOTAL:</b> Any score above a "0" is a "Stroke Alert"

# PATIENT REPORT TO EMERGENCY DEPARTMENT

- Patient's age, sex, and weight
- Mechanism of injury or medical problem
- Chief complaint with brief history of present illness
- Vital signs
- Level of consciousness
- General appearance, distress, cardiac rhythm
- Intervention by EMS (IV, medication, administration)
- ETA (The more critical the patient, the earlier you need to notify the receiving facility.)

# PREHOSPITAL MANAGEMENT OF AN ACUTE STROKE

- Assess the airway, breathing, and circulatory status.
- Check blood glucose.
- Obtain full set of vital signs.
- Review patient's medications.
- Perform 12 lead ECG.
- Establish IV access.

# ACUTE ISCHEMIC STROKE - IV-TPA CONTRAINDICATIONS

- Active internal bleeding
- Recent intracranial or intraspinal surgery or serious head trauma
- Intracranial conditions that may increase the risk of bleeding
- Bleeding diathesis
- Current severe uncontrolled hypertension
- Current intracranial hemorrhage
- Subarachnoid hemorrhage

# THE SOLUTION

1. Educate emergency medical services (EMS) professionals about assessment and triage of severe stroke patients in the field.
2. **Get more ELVO patients the treatment they need at Level 1 stroke centers – facilities with 24/7/365 neurointerventional care.**
  - a. **A new study (Holodinsky) shows that direct transfer to a Level 1 stroke center is better than the alternative, even if the stroke center is as many as 90 minutes away.**
3. Update EMS protocols in all 50 states to ensure more patients survive stroke.

# NEUROENDOVASCULAR STROKE SURGERY

- Neuroendovascular stroke surgery is a type of minimally invasive procedure that removes blood clots from a blocked artery.
- Landmark trials show that this treatment is highly effective in treating ischemic strokes caused by emergent large vessel occlusions (ELVO).

# THE RESULTS

- Improves life expectancy of patients who experience ischemic stroke by 5 years.
- Reduces stroke mortality by half.
- Could allow more patients to walk away from severe stroke if they get the right care.

# SURVIVING STROKE: JOHN'S STORY

<https://www.youtube.com/watch?v=lTqNvr2aDyg>

# THE SOLUTION

1. Educate emergency medical services (EMS) professionals about assessment and triage of severe stroke patients in the field.
2. Get more ELVO patients the treatment they need at Level 1 stroke centers – facilities with 24/7/365 neurointerventional care.
  - a. A new study (Holodinsky) shows that direct transfer to a Level 1 stroke center is better than the alternative, even if the stroke center is as many as 90 minutes away.
3. **Update EMS protocols in all 50 states to ensure more patients survive stroke.**

# STATE ADVOCACY

- Charted a path forward via rules or legislation in priority states: Arizona, Colorado, Massachusetts, New York, Ohio, and Tennessee.
- Working on a parallel track with state and regional stroke councils.

# TRAUMA MODEL COMPARISON

## DO STROKE PATIENTS DESERVE LESS?

Like Trauma, Stroke Patients Need a System That Helps Them Survive

### TRAUMA PATIENT

### SEVERE STROKE PATIENT

**TRIAGE**  
 Patient evaluated according to standardized criteria.

**TRIAGE**  
 Patient evaluation is not standardized.

**TRANSPORT**  
 Patient taken to life-saving trauma center (required by state law).

**TRANSPORT**  
 Patient taken to nearest hospital.

**TREATMENT**  
 Patient receives the right care as rapidly as possible.

**TRANSFER**  
 Nearest hospital is not equipped to treat severe stroke. Patient requires transfer to a Level 1 stroke center.<sup>1</sup>

**TREATMENT**  
 Patient arrives at Level 1 stroke center, but hours have been lost in transfer, jeopardizing recovery.<sup>2</sup>

<sup>1</sup>Less than 10 percent of severe stroke patients get the most effective treatment.  
<sup>2</sup>Due to time lost, 1 in 3 severe stroke patients who are transferred become ineligible for specialized stroke surgery.

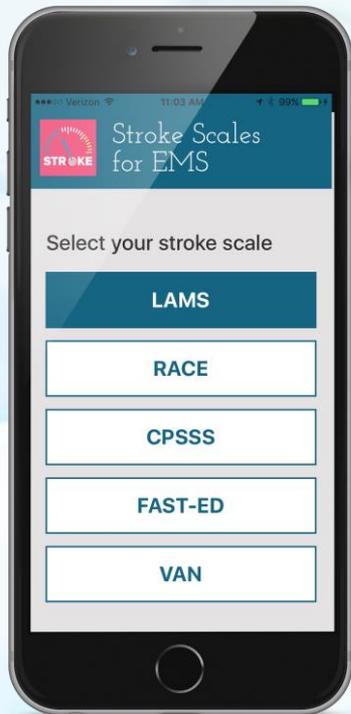

*If you had a stroke,

**RESOURCES FOR EMS**

# ABOUT THE APP

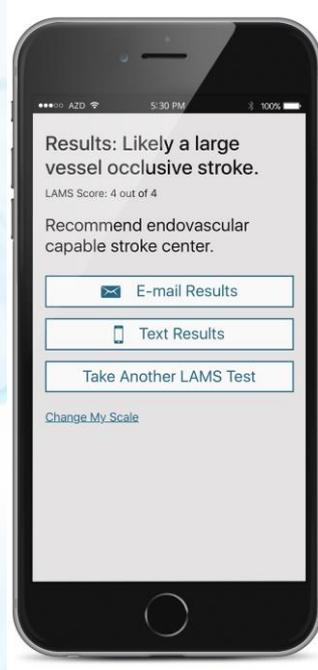

The Stroke Scales for EMS mobile application helps EMS personnel identify stroke severity and emergent large vessel occlusion (ELVO) in the field using stroke scales.

# ABOUT THE APP

- Features five stroke scales
  - The Los Angeles Motor Scale (LAMS)
  - Rapid Arterial occlusion Evaluation (RACE)
  - Cincinnati Prehospital Stroke Severity Scale (CPSSS)
  - Field Assessment Stroke Triage for Emergency Destination (FAST-ED)
  - Vision, Aphasia, Neglect (VAN)

# ABOUT THE APP

Based on results from the stroke scale you use, the app recommends the type of facility the stroke patient needs.

# AT-A-GLANCE

Complete the stroke scale.

Start

Stroke Scales for EMS

Select your stroke scale

- LAMS

# HOW TO DOWNLOAD

- The app is available for download in the iOS App Store and Google Play.
- Search for “Stroke Scales for EMS” to find and download the app.

# OTHER RESOURCES

- First Responders fact sheet
- Patient stories and videos
- Infographics and social media graphics

**FIRST RESPONDERS**

With neuroendovascular surgery, ELVO patients are at least twice as likely as those who do not receive the treatment to be independent 90 days after a stroke.

**THE REALITY**

- Stroke is a **leading cause of death** and long-term disability in the U.S.
- More than **795,000** people in the U.S. have a stroke every year.
- Stroke kills nearly **120,000** people each year.
- The vast majority of strokes (**87 percent**) are ischemic strokes, caused by a blood clot in the brain.
- Neuroendovascular surgery is a **minimally invasive** procedure that uses a catheter to remove the clot.
- There are neurointerventional **care teams** across the country who specialize in this procedure.

**THE ANSWER**

- Recent studies have shown that neuroendovascular surgery is highly effective at treating severe stroke patients who have an emergent large vessel occlusion (ELVO) — a clot that blocks a large vessel and cuts off significant blood flow to the brain. But less than 20 percent of patients who could benefit from this lifesaving treatment receive it.
